$1 1/2 = 1'-0''$

total allowable roof loads for different truss spacing

truss spacing	24"	32"	48"	96"
total roof load (psf)	66	49	33	15

member	force (lb)	moments (lb. in.)	M/SF + P/AC
A D	-3909	5812	.94
D E	-3471	-5812	.89
A B	3709		.99
B B	2574		.69
D B	-831		.16
B E	1017		.27

1. elevation of truss
2. joint 'A' nailing detail
3. joint 'B' nailing detail
4. joint 'C' nailing detail
5. gusset cutting detail
6. notation and loading diagram
7. 1/2" plywood gussets (both sides) at all joints
8. 2" x 6" top chord
9. 2" x 4" bottom chord
10. 2" x 4" web member 2 1/2"-10" lgth
11. 2" x 4" web member 6 1/2"-2" lgth
12. bottom chord should be cambered 3/4" at center
13. all joints must butt tight. Fit members full scale before cutting
14. [2] denotes number of nails from each side

NOTES:

- 2" x 6" lumber to be #2 grade spruce.
- 2" x 4" lumber to be construction grade or #2 grade spruce.
- plywood to be 1/2" sheathing grade douglas fir
- nails to be 2 1/2" #6 gauge truss gusset type (by the Steel Company of Canada or equivalent)
- total roof load is live load plus dead load. See Table F-1, Canadian Code for Farm Buildings 1970, for farm truss roof construction dead loads
- the allowable unit stresses for sawn lumber and plywood used in this truss design are those listed in "The Canadian Structural Design Manual 1970" with the following modification factors applied:

Low human occupancy farm buildings (1.25), snow load duration (1.15), load-sharing systems (1.10). For trusses 96" o.c., the load-sharing factor is not applied.
