

**Corn Response to Starter Fertilizers and Plant Growth Promoters  
NDSU Carrington Research Extension Center  
2008**

An experiment was conducted at the Carrington Research Extension Center in 2008 to evaluate corn response to starter fertilizers and growth promoters. A fall soil test indicated 60 lb N/ac, 10 ppm P<sub>2</sub>O<sub>5</sub>, 189 ppm K<sub>2</sub>O, and 5.9 pH. Nitrogen was applied at 83 lb/ac prior to planting. Mycogen '2K154' corn was direct-seeded into spring wheat stubble May 13 in 30-inch rows at 26,400 seeds/acre. The trial was harvested November 6.

Plant stand, days to silk, ear and plant height, harvest moisture, grain protein, starch content and test weight were similar among treatments (Table). Grain yield ranged from 82 to 112 bu/ac. Six gal/ac 10-34-0 applied 2x2 and 6 gal/ac 10-34-0 plus 1 pt/ac Torque applied in-furrow increased grain yield compared to the untreated check.

**Table.** Corn Resposne to Starter Fertilizers and Plant Growth Promoters.

Treatment	Rate	Placement	Plant Population	Days to Silk	Ear Height	Plant Height	Harvest Moisture	Grain Protein % @ 0% Moisture	Starch Content	Test Weight	Grain Yield
			plants/ac		inch			%		lb/bu	bu/ac
