

Figure 5. Seasonal changes for 1995 in crude protein content of the most abundant plant species on the grazing intensity trial. Reference lines indicate the crude protein requirement of a 1,000 lb lactating cow, average milkability (9.6%), and a 1,000 lb dry cow, middle third of pregnancy (7.0%) (NRC 1984).

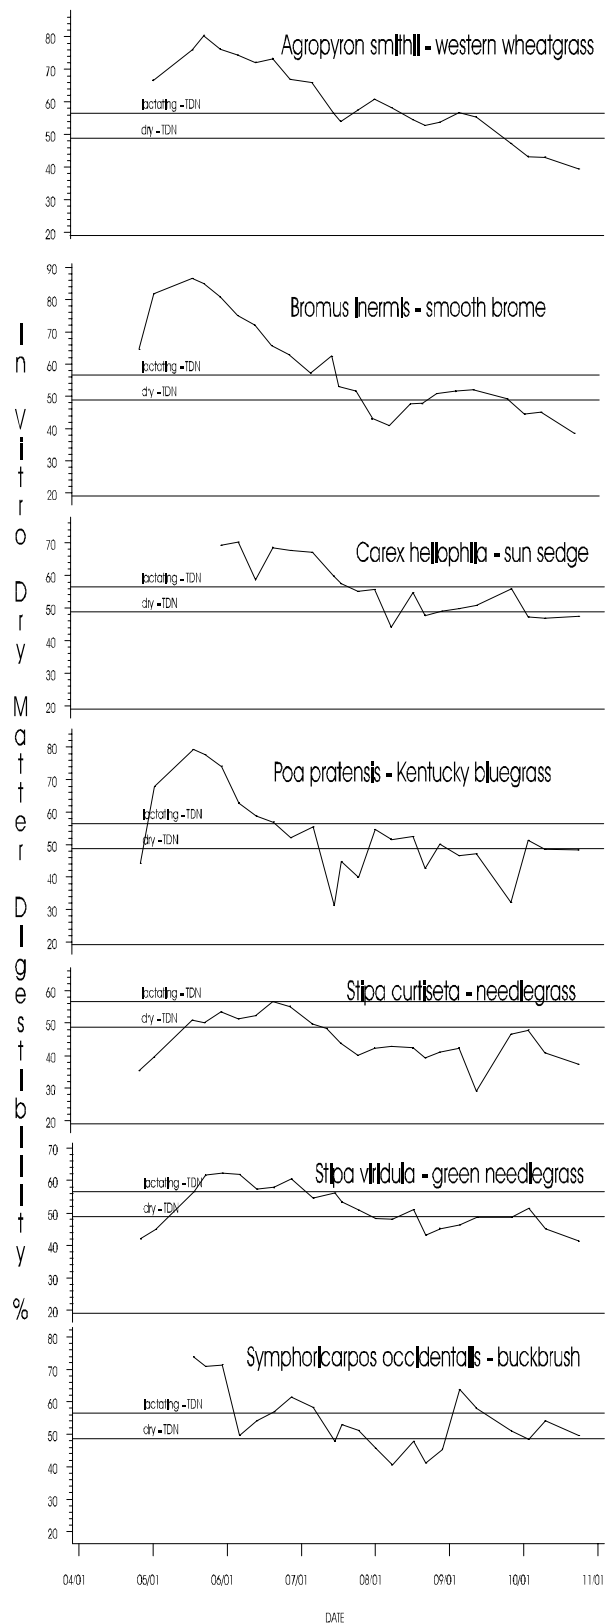

Figure 6. Seasonal changes for 1995 in the *in vitro* dry matter digestibility of the most abundant plant species on the grazing intensity trial. Reference lines indicate the total digestible nutrient requirement of a 1,000 lb lactating cow, average milkability (56.6%), and a 1,000 lb dry cow, middle third of pregnancy (48.8%) (NRC 1984).
