### HETTINGER BRANCH STATION

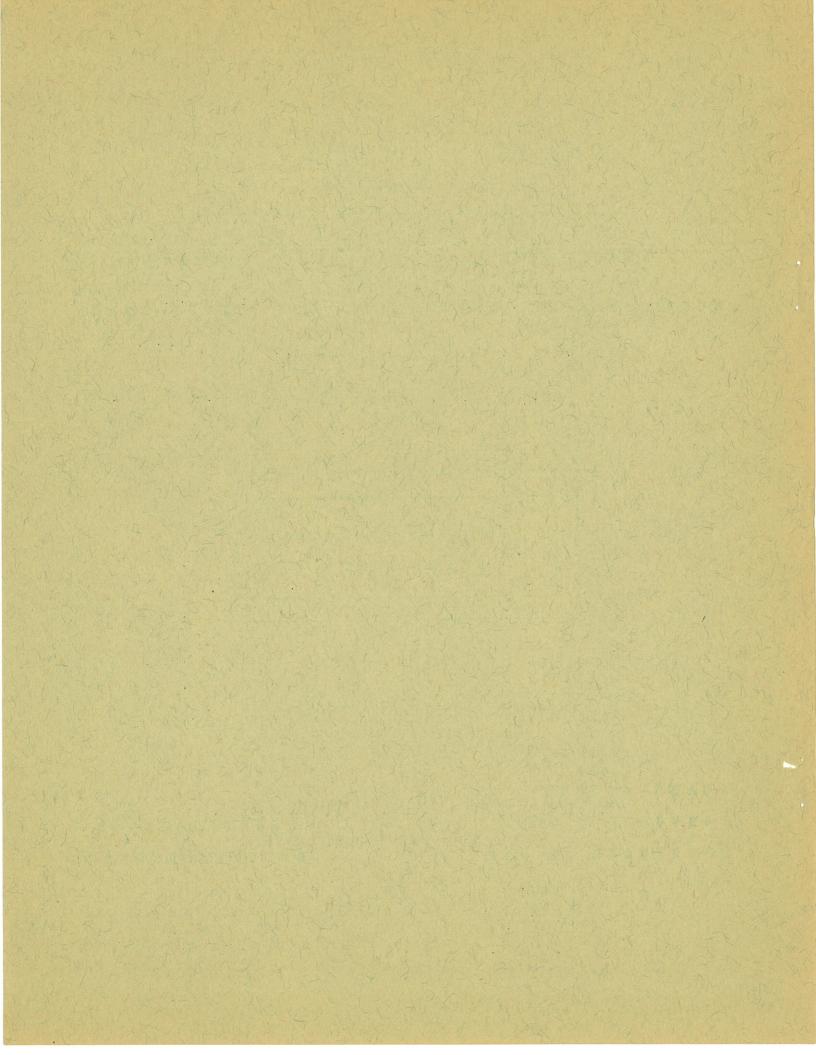

AGRICULTURAL EXPERIMENT STATION

NORTH DAKOTA UNIVERSITY OF AGRICULTURE

A DAMS COUNTY
FEBRUARY 7, 1961
HETTINGER, N. DAK.

LEROY JOHNSON, SUPERINTENDENT

#### SECOND ANNUAL WESTERN DAKOTA SHEEP DAY

Hettinger Experiment Station Hettinger, North Dakota February 7, 1961

#### Program

- 1:00 Production testing in sheep
  M. A. Kirkeide
  Extension Livestock Specialist
  Fargo, North Dakota
- 1:15 Report of Experimental work at the Hettinger Station C. LeRoy Johnson, Supt.
- 1:45 Why I include sheep in my farm program
  Henry Hagen
  Reeder, North Dakota
- 2:00 "Barley for Feeder Lambs" and "Sheep Diseases"
  Merle R. Light
  Associate Professor of Animal Husbandry
  North Dakota State University
- 2:30 Agriculture and Farming
  Arlon G. Hazen
  Dean of Agriculture and Director of
  Agricultural Experiment Station
  North Dakota State University
- 3:00 Question and Answer period
- 3:15 Awarding of door prizes
- 3:30 Coffee

### SECOND ANNUAL MESTERM DAKOTA SHEEP DAY

Hettinger Experiment Station Rettinger, Worth Dakota February 7, 1961

#### Program

- 1:00 Production testing in sheep M. A. Kirkeide' Extension Livestock Specialist Pargo, North Dakota'.
- 1:15 Report of Experimental work at the Hettinger Station C. LeRoy Johnson, Suptr
  - 1:45 Why I include sheep in my farm program ... Henry Hagen Reeder, North Dakota
  - 2:00 "Barley for Feeder Lambs" and "Shaep Diseases" :
    Meria R. Light

    North Pakota State University
    - 2:30 Agriculture and Farming .

      Arlon G. Hager

      Dean of Agriculture and Director of

      Agricultural Experiment Station .

      North Dakota State University
      - 3:00 Question and Answer period
        - 3:15 Awarding of door prizes
          - 3:30 Coffee

#### COBALT FOR LAMBS

Cobalt is one of the mineral elements classified as a trace mineral, meaning that it is required in very small amounts to meet the nutritional requirements of the animal. The symptoms of cobalt deficiency in lambs are lack of appetite, anemia, lack of thrift and generalized weakness. In fact, when severely deficient, lambs will appear to "starve while standing in front of a full feed bunk". The symptoms of this disease show marked similarities to those of internal parasitism. On occasion, cobalt deficiencies have been confused with parasitism. The amount of cobalt required per lamb is very small and can be met adequately by feeding salt containing 0.1 ounce of cobalt (0.2 ounce of cobalt chloride) per 100 pounds of salt. Hays and pasture grasses containing 0.07 parts per million of cobalt on a dry matter basis have been shown to prevent occurrence of cobalt deficiency in sheep. North Dakota is not definitely known to have cobalt deficient areas. It is thought, however, that cobalt deficiency may occur sporadically. There has been some question as to whether or not the feeding of trace mineralized salt satisfied the needs for cobalt in sheep. Therefore, an experiment was designed to test the value of using cobalt "bullets" for lambs. Cobalt bullets are bullets that are orally administered. They lodge in the stomach and are said to dissolve slowly over a considerable period of time. Theoretically, this guarantees enough cobalt to meet nutritional requirements for an extended period.

Procedure: Thirty ewe and thirty ram lambs were paired and allotted into four groups. One group of each sex was given cobalt "bullets". The lambs were pastured together on typical western North Dakota range pastures of native and crested wheat grasses. Due to drouth conditions, the pastures were extremely poor the first year of trial but would be considered very good for the second year of trial. Lambs were drenched once for internal parasites at the start of the trial. A commercial trace mineralized salt was mixed with dicalcium phosphate and phenothiazine and was provided free choice. Lambs were weighed every 30 days. The results of the first 120 day trial are summarized in table 1. Results of the second 120 day trial are summarized in table 2.

Cobalt, is one of the mineral elements charathied as a traco-mantral; manhing that it is required in very small amounts to meet the nutritional regulirements of the animal. The symptoms of cobalt deficiency in lambs are lack of appetite, anemia, lack of thrift and generalized weatness. In fact, whom severely deficient, lambs will appear to "starve while standing in front of a full feed bunk". The symptoms of this disease show marked similarities to those of internal parasitisms On occasion, cobalt deficiencies have born confused with parasition. The amount of cobalt required per lamb is very small and car be met adequately by feeding salt containing 0.1 ounce of cobalt (Q:2, owner of cobalt chloride) per 100 pounds of salt. Hays and pasture grasses contagning 0:07 party per million of cobalt on a dry matter bisis have been shown to prevent occurrence of cobalt deficialmential selects North Dakets is not definitely known to have cobalt deficient areas .. It is this this this postwer, that cobale deficier ency may, occur sporadicallys. There has been bone question as to whether or not their feeding of grace mineralized salt batisficating needs for cobife in start. Therelore, an experiment was designed to test the value of using cobalt ballets ifor lambs. Cobalt bullets are bullets that are orally administered. They lodge in the stomack and are said to dissolve slowly ever a considerable beriod of times Theorietically, this guarantees enough cobalt to meet nutritional requirements for an ex-

Procedure: Thirty eve and thirty ram Lambs were paired and allotted into four groups. One group of each sex was given cobalt "bullets". The lambs were pastured together on typical western North Bakota range pastures of native and created wheat grasses. Due to drouth bonditions, the pastures were extremely poor the first year of trial but would be considered very good for this second year of trial. Lambs were drenched once for internal pharestes at the standofully writie? A conserving trice with distinctum phosphate and phosechiazine and was profit wide at the standofully and greater and was profit. The results of the Wide Winds Was profit. The results of the Winds Was profit.

### COBALT BULLETS FOR PREGNANT EWES (a progress report)

Review the discussion concerning cobalt for lambs.

After obtaining no significant results from the use of cobalt bullets for lambs, it was decided to test the value of their use on pregnant ewes.

Procedure: The purebred flock of Columbia ewes at the station was divided into two groups so as to have in each group, equal influence of sires, weight and age of ewes and equal distribution of ewes with different management backgrounds resulting from other trials being conducted on the same band of ewes. One group was given cobalt bullets on Nov. 28, 1959.

#### Results:

	Cobalt	No cobalt
No ewes	48	48
Ewe gain Oct. 29 to Jan. 30	11.7	13.0
Av. fleece wt	10.45	10.65
Av. birth wt. lambs	11.75	11.75
Av. 30 day wt. lambs	29.34	27.76
Av. age (days) at weaning	132.6	136.46
Av. weaning wt. lambs	88.98	86.12
Av. lamb wt per day of age	.67	. 63
Percent of lambs dropped	116.66	129.16
Percent of lambs weamed	106.25	104.16
Percent of ewes dropping twins	33.33	39.58
Percent of ewes weaning a set of twins	27.08	25.00
Percent of twins weaned as sets of those dropped	75.00	52.63
Av. birth wt. of twins	10.8	10.28
Av. birth wt. of singles	12.8	12.52
Av. 30 day wt. of twins	26.8	24.44
Av. 30 day wt. of singles	31.88	30.96
Av. weaning wt. of twins	85.84	80.28
Av. weaning wt. of singles	92.24	91.96
Av. age (days) at weaning-twins	136.15	133.72
Av. age (days) at weaning-singles	128.92	135.20
Av. lamb wt. per day of age-twins ,,,,,,,,,,,,	. 63	. 60
Av. lamb wt. per day of age-singles	.72	. 68
Av. wt. of lamb produced per ewe at 120 days	85.68*	78.87*

All weights are given in pounds or fractions thereof.

\*Av. wt of lambs produced per ewe at 120 days obtained by multiplying av. wt.

per day x 120 days x percent of lambs weamed.

### COBALT BULLETS FOR PREGNANT EVES (a progress report)

Review the discussion concerning cobalt for lambs.

After obtaining no significant results from the use of cobait bulists for lambs, it was decided to test the value of their use on pregnant eves.

Procedure: The purebred flock of Columbia ewes at the station was divided into two groups so as to have in each group, equal influence of sixes, weight and age of ewes and equal distribution of ewes with different management backgrounds resulting from other trials being conducted on the same band of ewes. One group was given cobalt bullets on Nov. 28, 1959.

#### Results:

No cobalt	Cobalt	
48	48	No ewes
13.0	11.7	Ewe gain Oct. 29 to Jan. 30
10.65	10.45	Av. fleece wt
11.75	11.73	Av. birth wt. lambs
27.76	29,34	Av. 30 day wt. Lambs
136,46	132.6	Av. age (days) at weaning
86.12	80.88	Av. weaning wt, lambs
.63	.67	Av. lamb we per day of age
129.16	116.66	Percent of lambs dropped
104.16	106.25	Percent of lambs weaned
39.58	33,33	Percent of ewes dropping twins
25.00	27.08	Percent of ewes weating a set of twins
52.63	75.00	Percent of twins weamed as sets of those dropped.
10,28	10.8	Av. birth wt. of twins
12.52	12.8	Av. birth wt. of singles
24,44	26.8	Av. 30 day wt. of twins

80.28	85.84	Av. weaning wt. of twins
94.16	92.24	Av. weaning wt. of singles
133.72	136,15	Av. age (days) at wearing-twins
135.20	128.92	Av. age (days) at weaning-singles
00.	.63.	Av. lamb wt. per day of age-twins, sometimes
80.	572	Av. Jamb wt. per day of age-singles
78,87	*80.68*	Av. wt. of Lamb produced per ewe at 120 days

All weights are gives in pounds or fractions thereof.

\*Av. wt of lambs produced per ewe at 120 days obtained by multiplying av. wt.

Summary: There was no difference in the average gain of the ewes between October 29 (the end of breeding season) and January 30 (just before lambing). The ewes receiving cobalt dropped a lower percentage of lambs than those that got cobalt by 12.5% but weaned a higher percentage by 2.09% which might indicate a somewhat stronger livability for those lambs from ewes that received cobalt. There was no difference in wool production. The ewes receiving cobalt produced 6.81 pounds of lamb more per ewe at 120 days than those in the check lot. This would be more than enough to pay for the cost of the cobalt bullets at 42¢ each. The information collected on this first year of trial shows that there is an apparent advantage in giving cobalt bullets to pregnant ewes. Trace mineralized salt plus dicalcium phosphate at a ratio of 3 to 1 was fed free choice throughout the winter in open troughs. Perhaps the snow that would fall from time to time making the salt hard might have reduced the proper salt intake thus bringing about a shortage of cobalt for those ewes not getting the bullet. It is important to remember that this is only one year's trial and must be repeated before it can be considered conclusive.

Summary: There was no difference in the average gain of the eves between October 29 (the end of breeding season) and January 30 (just before lambing). The owes receiving cobalt dropped a lower percentage of lambs than those that got tobalt by 12.5% but weared a higher percentage by 2.05% which might indicate a somewhat eftout get livability for those lambs from ewes that received cobalt. There was no difference in wool production. The eyes receiving cobalt produced 6.81 pounds of lamb more one at 120 days then those in the check lot. This would be more than enough to pay for the cost of the cobalt bullets at 4.2¢ each. The information collected on this first year of trial shows that there is an apparent advantage in giving cobalt bullets to pregnant ewes. Trate mineralized salt plus dicalcium phosphate at a ratio of 3 to 1 was fed free choice throughout the winter in open treughs. Perhaps the snow that would fall from time to time making the salt hard might have reforced the proper salt intake thus bringing about a shortage of cobalt for those eves not getting the bullet. It is important to remember that this is only one year's trial and must be repeated before it can be considered conclusive.

## CREEP FEEDING EARLY LAMBS UNTIL PASTURES ARE AVAILABLE (a program report)

<u>Purpose</u>: To determine the value of creep feeding early lambs until pastures are available at which time they are turned to pasture with their mothers.

Procedure: Our purebred flock of Columbia ewes was used for this trial also. The ewes were divided at lambing time into two groups of similar background. Both groups had as nearly as possible, equal representation of influences such as weight, age and management background. One group was creep fed until pasture time and the other group was not.

#### Creep ration:

750 lbs. Barley 750 lbs. Oats

200 lbs. Wheat Bran

200 lbs. Soybean oil meal

100 lbs. molasses 40 gms. Aureomycin

Cost of creep feed- \$56.00 per ton.

Cost of creep feed per lamb---\$.59

#### Results:

	Lot 1 (Creep fe	Lot 2 (no creep)
No. of ewes	48	48
Av. birth wt. lambs	11.33	11.48
Av. 30 day wt. lambs	29.09	28.23
Av. wt. at pasture	54.31	47.56
Av. age (days) at pasture	67.45	69.28
Av. wt. of lambs per day of age at pasture	.82	.686
Av. wt. at weaning	89.9	85.34
Av. age (days) at weaning	134.45	133.7
Av. wt. of lambs per day of age at weaning	. 668	. 638
Number of lambs at weaning	51	49
Number of sets of twins at weaning	13	11
Average weaning wt. adjusted to 120 days	80.16	76.56
Difference in wt. per lamb at 120 days	3	. 60

All weights are given in pounds or fractions thereof.

# OREEP FEEDING EARLY LAMBS UNTIL PASTURES ARE AVAILABEE (a program report)

Purpose: To determine the value of creep feeding early lambs until pastures are available at which time they are turned to pasture with their mothers.

Procedure: Our purebred flock of Columbia eves was used for this trial also. The ewes were divided at lambing time into two groups of similar background. Both groups had as nearly as possible, equal representation of influences such as weight, age and management background. One group was creep fed until pasture time and the other group

Creep ration:

750 lbs. Barley

750 lbs. Oats

200 lbs. Wheat Bran

200 lbs. Soybean oil meal

100 lbs, molasses

40 gms. Aureomycin

Cost of creep feed-- \$56.00.per ton.

lost of creep feed per lamb --- \$.59

#### Results:

Lot 2	Lot L	
(no-creen)	(Creep Eed)	
4.8	-84	No. of ewes
11,48.	11,33.	Av. birth wt. lambs
28.23	29.09	Av. 30 day wt. lambs
47.56	54.31	Av. wt. at pasture
69.28-	67.45	Av. age (days) at pasture
. 686	.82	Av. wt. of lambs per day of age at pasture
85.34	6.68	Av. wt. at wearing
133.7.	134.45	Av. age (days) at weaning
.638	. 668	Av. wt. of lambs per day of age at weaning
647	51	Number of lambs at wearing
	. 21	Number of sets of twins at weaning
76.56	80.16	Average weaning wt. adjusted to 120 days
	3.60	Difference in wt. per lamb at 120 days

All weights are given in pounds or fractions thereof.

Summary: The lambs in lot 1 gained faster while on creep feed than those in lot 2 by .13 pounds per day. However, after being turned to pasture those lambs that had not been creep fed started to catch up. At weaning, there was only .04 lbs. per day of age difference. Lambs would have to sell for \$16.40 per cwt. at market to pay the extra cost of feeding creep feed with no allowance for extra labor and equipment.

From the data collected on this one year's trial, it appears that creep feeding from birth to pasture would not be profitable. This test will be repeated before being considered conclusive information.

Summary: The lambs in lot I gained faster while on creep feed than those in lot 2 by :13 pounds per day. However, after being turned to pasture those lambs that had not been creep feed started to catch up. At weaning, there was only .04.1bs. per day of age difference. Lambs would have to sell for \$16.40 per cwt. at market to pay the entra cost of feeding creep feed with no allowance for extra labor and equipment.

From the data collected on this one year's trial, it appears that creep feeding from birth to pasture would not be profitable. This test will be repeated before being considered conclusive information.

# FARM FLOCKS OF SHEEP ON WESTERN NORTH DAKOTA FARMS ( a progress report)

Objectives: 1. To determine whether or not sheep production should be considered by farmers in the area who have limited amounts of pasture available. 2. To determine what management program should be recommended.

Procedure: Thirty Columbia ewes of mixed ages were used. Twelve of these were registered but of lower quality than the rest of our purebred flock. Eighteen were grade Columbias. They were bred to two suffolk ram lambs to start lambing about February 1st. A pole type shelter was constructed which served as housing all winter with no specially heated lambing quarters. Lambs were creep fed until May 1st when they were weaned and the ewes were turned to pasture. The lambs were kept on feed until marketed. From weaning to market, they were self fed whole barley and alfalfa hay. Complete records were kept of feed costs and returns. Lambs were marketed in two groups as they reached the desirable market weight and the choice grade. The first marketing was 16 head on June 13 and the second was 11 head on July 25.

#### Results:

Total feed cost for ewes and lambs
Estimated replacement cost at 20% 120.00
Housing (pole barn @\$350.00 depreciated in 20 years) 17.50
Shearing @\$.40 each
Veterinary expense including drenching and prorated
cost of tools etc. (estimated \$1.00 per head) 30.00
Cost of bedding 20.00
Total costs\$787.54
Wool sold (29 fleeces) 283 lbs. @ 45c per lb127.35

Summary: This test shows that this lot of 30 ewes showed a net loss of \$101.67. Costs for summer pasture, fence, water and labor were not added as it was felt that these were extremely variable from farm to farm. It will be noted that only a 90% lamb crop was marketed. This was partly due to the high percentage of dry ewes (16.6%) and also two lambs died from urinary calculi just prior to shipping. Feed supply in this area was extremely short reflecting higher prices and resulting in higher than normal feed costs for this trial. It will also be noted that lambs sold in June brought \$23.75 per cwt. while those sold in July brought \$19.50. Both groups topped the quoted market at St. Paul on the day sold. This trial will be repeated several more years to try to eliminate this variation in prices from year to year. Some corrections will be made in management next year in an effort to iron out some of the factors resulting in this year's loss. We will force feed salt in the ration to try and prevent urinary calculi. We will start lambing about three weeks earlier in an attempt to get more lambs ready for the early, higher market. We will continue to make corrections from year to year in a search for a management system that might show a profit from farm flocks in this area.

Summary: This hest shows that this lot of 30 ewes showed a net loss of \$101.67. Costs for summer pasture, fence, water and labor were not added as it was felt that these were extremely variable from form to farm. It will be noted that only a 90% lamb crop was marketed. This was partly due to the high percentage of dry ewes (16.6%) and also two lambs died from urinary calculi just prior to shipping. ing in higher than normal feed costs for this trial. It will also be noted that lambs sold in June brought: \$23.75 per cwt. while those sold in July brought \$19.50. Both groups topped the quoted market at St. Paul on the day sold; This trial will be repeated several more years to try to eliminate this variation in prices from salt in the ration to try and prevent urinary valcult. We will start lambing
