

Study Name: Herbicide evaluation for control of wild oat in HRSW.

Study Number: 9913

Objectives: Evaluate experimental and registered herbicides for wild oat control in hard red spring wheat. Determine if split applications of specific herbicides will provide better control than a single application.

Results: Due to the wet spring conditions we could not get into the field. Most of the wild oat emerged and was 6-8 inches tall before we could get into field. After tilling the field, new flushes of wild oat did not come. Therefore, the study could not be conducted.
