

Welcome to the NDSU Potato Blightline for August 12 sponsored by Syngenta Crop Protection.

Current recommendations:

Late blight has not been reported in our region of ND, MN or MB. The late blight severity threshold value of 15 has been reached at all locations. For our conditions, application of a protectant fungicide such as mancozeb or chlorothalonil on a 7-10 day schedule is recommended. Continue to scout potato fields for late blight especially in low lying areas and along shelterbelts that remain wet longer where disease is most likely to develop. Late blight been confined to east of the Mississippi River this year; no late blight has been reported west of the Mississippi so far.

Thank you for using the NDSU Blightline
