

North Dakota Canola Variety Trial Results for 2017 and Selection Guide

Hans Kandel and Adnan Akyüz (NDSU Main Station); Mike Ostlie, Blaine Schatz and Jesper Nielsen (Carrington Research Extension Center); Eric Eriksmoen and Joe Effertz (North Central Research Extension Center, Minot); Bryan Hanson, Travis Hakanson and Lawrence Henry (Langdon Research Extension Center); and Jerry Bergman, Gautam Pradhan, Justin Jacobs, Emma Link and Tyler Tjelde (Williston Research Extension Center).

Introduction

Canola is a major oil crop in the northern Great Plains, particularly in North Dakota. In 2017, North Dakota accounted for approximately 79 percent of the 2.16 million canola acres planted in the U.S. This publication summarizes canola variety performance at the various North Dakota State University Research Extension Centers. The relative performance of the hybrids is presented in table form.

Give special attention to yield results of those trials nearest to your production area when evaluating varieties or hybrids in these trials. Also, attempt to view yield averages of several years rather than using only one year's data as a determining factor. In addition, consider other agronomic characteristics, such as maturity, lodging score and oil percentages, if available.

Research specialists and technicians helped with the field work and data compilation. The assistance given by many secretaries in typing respective portions of the document is very much appreciated. A special thank you goes to Lisa Johnson, Extension Plant Sciences secretary, for assisting in the compilation of this publication.

2017 Growing Season Update

Canola fieldwork began by the end of April. Planting progress was near normal, and by May 14, 44 percent of the acres had been planted, compared with the average of 45 percent on the same date. On May 15, the topsoil moisture was rated at 69 percent adequate and 9 percent surplus.

Early canola stands varied across the region, depending on soil moisture availability and rainfall after planting. By July 9, 82 percent of the canola crop was flowering, compared with the average of 80 percent on the same day. Many parts of the state experienced dry summer conditions. By the last week in July, the North Dakota office of the National Agricultural Statistics Service reported the canola crop condition as 32 percent "good" and 1 percent "excellent," compared with 69 "good" and 9 percent "excellent" in 2016.

By Sept. 17, 91 percent of the canola acres were harvested, which was ahead of the 85 percent average on the same date. In general, the 2017 season was dry and yield is estimated to be 1,410 pounds per acre for North Dakota.

About This Publication

Variety trial data from all NDSU Research Extension Centers for all crops can be found at www.ag.ndsu.edu/varietytrials. The agronomic data presented in this publication are from replicated research plots using experimental designs that enable the use of statistical analysis. The LSD (least significant difference) numbers beneath the columns in tables are derived from the statistical analyses and only apply to the numbers in the column in which they appear.

If the difference between two varieties exceeds the LSD value, it means that with 95 or 90 percent probability (0.05 or 0.10 level), the higher-yielding variety has a significant yield advantage. If the difference between two varieties is less than the LSD value, then the variety yields are considered similar. The abbreviation NS is used to indicate “no significant difference” for that trait among any of the varieties.

The CV is a measure of variability in the trial. The CV stands for coefficient of variation and is expressed as a percentage. Large CVs mean a large amount of variation that could not be attributed to differences in the varieties. In the tables, the mean indicates the average of the observations in the column. Only compare values within the table and look for trends for the desired trait among different experimental sites and years. Oil and harvest yield were adjusted to 8.5 percent moisture. Tables 4 and 5 are summary tables, with yields expressed as a percentage of the trial mean (indicated on the bottom) of the various trials reported in subsequent tables.

Presentation of data for the varieties tested does not imply approval or endorsement by the authors or agencies conducting the tests. NDSU approves the reproduction of any table in this publication only if no portion is deleted, appropriate footnotes are given, the order of the data is not rearranged and NDSU is credited for the data.
