Personal Action Plan

Developing a personal action plan helps us manage stress to live a long, healthy life. To develop your action plan for coping with stress, complete the following steps:

1. Write down two or three of your major stressors.
   (Sources of stress from previous page)

2. Determine a realistic goal for each stressor and write it down. (How do you want things to be?)

3. Identify activities or strategies that will help you complete each goal. (What do you need to do to reach this goal?)

4. Determine how much time you will need to reach each goal.

5. Think about who might help you reach each goal. (Who can you depend on to hold you accountable for reaching your goal?)

6. How will you celebrate when you reach each goal? (What can you do for yourself to celebrate this accomplishment?)

Stress and Your Health

Constant stress can lead to many diseases. For example, high blood pressure as a result of stress can cause heart problems, including heart attacks. Stress also can cause headaches, migraines, back pain and ulcers. Research also has associated stress with a weak immune system. Because the immune system is responsible for fighting diseases and germs that attack the body, a person with chronic stress could become ill more frequently.

In addition, people who experience chronic stress may try to find relief from drugs, smoking or alcohol. However, these types of stimulants provide a feeling of relief that lasts only for a brief period of time. In the long term, the person is likely to become addicted, causing the stress to get worse.

Common Symptoms of Stress

- Loss of appetite or overeating
- Difficulty sleeping or sleeping excessively
- Low energy
- Frequent colds and infections
- Muscle tension and aches
- Increased substance use
- Crying spells
- Poor concentration
- Constant worry
- Feeling blue
- Tension and irritability
- Difficulty making decisions

Can you tell when you are experiencing stress? What are your personal warning signs?

Sources of Stress

Once you realize you are stressed, determining what is causing you stress is important to control it. Think about two or three factors that cause you the highest stress and write them here:

- __________________________________________________________________________

Coping With Stress

We can’t eliminate or stop stress, but we can manage it. Practicing healthy lifestyle behaviors is important to coping with stress. Here are a few examples:

- **Nutrition** – Limit stress-inducing foods, such as caffeine, monosodium glutamate, sugar and saturated fats, and be careful with “comfort foods.”

- **Physical exercise** – Make time for at least 30 minutes of exercise three to five times per week, but preferably daily, because it reduces and prevents stress and promotes well-being.

- **Sleep** – Get seven to nine hours of sleep each night to keep yourself in balance.

- **Limit smoking and alcohol** – Feelings of comfort are short-lived. Smoking and drinking can worsen the situation.

- **Financial management** – Worry over money problems can cause issues with sleep, appetite, addictions, etc.

In addition, developing individual responses is important for dealing with stress. Review the list of suggestions and see if you find ideas that might work for you:

- Learn relaxation techniques
- Make time for fun
- Laugh
- Share your concerns with others
- Create a quiet scene
- Focus on important relationships
- Seek education, help or counseling for issues that cause the stress

Keep in mind that coping with stress is very personal. Add those ideas that work for you and write them here:
