

# Corn Hybrids Tested by NDSU in 2010

The following table summarizes the relative yield (as a percent of the trial mean) of corn hybrids for each location where they were tested by NDSU in 2010. Hybrids are listed in the order of their relative maturity (earliest hybrids first and latest hybrids last). The relative maturity used is that assigned by the company marketing the hybrid. There were 13 different locations where hybrids were tested in 2010 and these locations are listed across the top of the table. Hybrids with percentages greater than 100% were above average for yield at that location. Select hybrids that did well across multiple locations. The last three columns in the following table are derived from the mean of three locations and therefore should be given more weight when considering the hybrid's performance. Additional data for each site can be obtained from the NDSU Extension Service Website at: <http://www.ag.ndsu.edu/varietytrials/corn> . For questions about this publication and to obtain additional copies, contact [joel.ransom@ndsu.edu](mailto:joel.ransom@ndsu.edu).
